

ABSTRACT OF THE DISCLOSURE

A carpet slide for use as a recreational entertainment device includes a first member having a predetermined shape and a predetermined size. The first member is formed from a flexible sheet of material having an upper surface and a bottom surface. An at least one strap like member having a first end and a second end is provided. A first mechanism is disposed along the upper surface of such first member adjacent a first outer edge portion thereof between a front portion of the first member and a back portion of such first member for engaging a first end of the at least one strap like member. A second mechanism is disposed along the upper surface adjacent a radially opposed second outer edge portion thereof between the front portion of such first member and the back portion of such first member for engaging a second end of such at least one strap like member.
